$$a \le \theta \sum_{i=1}^{n} x_i^2 \le b \iff \frac{a \le \theta}{\sum_{i=1}^{n} x_i^2} \le \frac{b}{\sum_{i=1}^{n} x_i^2}$$

El intervalo de confianta para b al nivel 1-a quech

$$\int C_{1-x}(\theta) = \left(\frac{a}{\sum_{i=1}^{n} x_i^2}, \frac{b}{\sum_{i=1}^{n} x_i^2}\right)$$

Si particularizamos para el caso de probabilidad de colos iguales obtenemos que

$$a = \chi_{2n-1-\frac{\alpha}{2}}^{2} \quad con \quad F_{\chi_{2n}^{2}}\left(\chi_{2n-1-\frac{\alpha}{2}}^{2}\right) = \frac{\alpha}{2}$$

$$b = \chi_{2n-\frac{\alpha}{2}}^{2} \quad con \quad F_{\chi_{2n}^{2}}\left(\chi_{2n-\frac{\alpha}{2}}^{2}\right) = 1 - \frac{\alpha}{2}$$

Por tanto el intervalo queda como:

$$IC_{1-\alpha}(\theta) = \left(\frac{\chi_{2n:1-\frac{\alpha}{2}}^2}{\frac{\pi}{2}}, \frac{\chi_{2n:\frac{\alpha}{2}}^2}{\frac{\pi}{2}}\right)$$
